INTELLIGENT Business insights in Risk and Security

They say knowledge is power and this could not be truer when your key business stakeholders need concise knowledge to make informed decisions on mitigating business risk. Having little or no knowledge can financially impact business, with the inability to implement the appropriate risk-mitigating strategies.

"...the delayed process of communicating information to our stakeholders due to disparity of information across our organisation in spreadsheets and personal emails is a cumbersome, time-consuming process... ",

SIMTRACK™ – Security Incident Management Tracking is the leading secure, private cloud, Australian-based Software as a Service (SaaS) solution. It delivers a secure and unified centralisation environment to business, allowing the management, tracking and investigation of security-related incidents. Return on investment is twofold. 1. Organisations receive accurate insights and intelligence, allowing informed decisions to be made about which risk-mitigating approaches should be taken. 2. A cohesive system allows those responsible for security to increase productivity and efficiency. Less time is spent on collating and managing information and focus is directed towards overseeing, analysing, planning and strategising security matters.

With thirty seven ready to use incident categories that can be refined further if required such as; Fraud, Threats, Assaults, Vandalism, Illegal Items...etc coupled with its modern, intuitive design, users are guided through a simple and easy-to-use data-entry wizard. This framework ensures the right information is always captured, leading to higher levels of accuracy in reporting. Built with complete mobile and tablet support, SIMTRACK™ allows incidents to be reported as they happen, where they happen.

Through SIMTRACK™'s secure administrative access, security personnel and investigators can perform and have access to many functions and process allowing the building of case histories for the more involved incidents. Communicating with various stakeholders either internal or external agencies such as law enforcement, detailing repeat offenders/persons of interest, configurable escalation levels to name a few.

A centralised data store ensures that consistent information can be shared and viewed by authorised key business stakeholders quickly. Powerful insights through real-time, inbuilt reporting and drill-down functions, assist in identifying trends, risks and incident hotspots. A dynamic risk-versus-business impact report quickly shows common themes and hotspots across the organisation.

A powerful feature of SIMTRACK™ is its ability to connect related incidents. These may lie across multiple locations or similar types and involve one or many persons of interest. Running our unique cross-reference report allows you to visualise these patterns at a higher level with the ability to drill down to view specific incident details.

SIMTRACK™ does not distinguish between industry types with its powerful, modularised structure. With a flexible but tightly-structured, secure access model, it is able to fulfil the most diverse access requirements in any organisation, simple or complex. Data is hosted in privately-owned and managed server environment, located in state-of-the-art, tier 3 data centres in Australia only (Private Cloud).

In operation since 1999, 3 Dimensional Consulting is an Australian, privately-owned and operated company based in Melbourne. It provides high-end solutions and services in security product offerings, bespoke software solutions and managed services.
